Abstract no.7524. Uch.zap.Mosk.obl.ped.in-ta, 1959, 77,
53-78

TEXT: Let D be a complete doubly circular region the boundary S of which is analytically convex from the exterior. A.A.Temlyakov has shown that the hypersurface S admits the parameter representation $|w|=r_1(\tau)$, $|z|=r_2(\tau)$, where the functions $r_1(\tau)$ and $r_2(\tau)$ defined on the interval $[0,1]$ satisfy the conditions

$$r_1(0) = 0, \quad r_1(1) < \infty, \quad r_1'(\tau) > 0$$

$$r_2(\tau) = \exp \left\{ - \int_{1-\tau}^1 \frac{d}{1-t} \ln r_1(t) dt \right\}.$$

Let S_r ($0 < r \leq 1$) denote the hypersurface $\{|w|=rr_1(\tau), |z|=rr_2(\tau)\}$.

Let furthermore

Estimations and entire functions

$$M_F(r) = \max_{(w,z) \in S_r} |F(w,z)|, \quad A_F(r) = \max_{(w,z) \in S_r} \operatorname{Re} F(w,z),$$

$$m_F(r) = \min_{(w,z) \in S_r} |F(w,z)|,$$

where $F(w,z) = \sum_{m,n=0}^{\infty} a_{m,n} w^m z^n$ is a function analytic in D. Starting from the integral representation of Temlyakov the author at first obtains certain estimations of the numbers $|a_{m,n}|$ by $M_F(1)$ and $A_F(1)$. For the case that D is the bicylinder $\{|w| < R_1, |z| < R_2\}$ it is proved especially (theorem 1) that

$$|a_{m,n}| \leq 2(A_F(1) - \operatorname{Re} F(0,0))R_1^{-m}R_2^{-n}.$$

Furthermore, with the same method, the author proves the following inequalities between $M_F(r)$ and $A_F(1)$, $m_F(r)$ and $M_F(1)$ (theorems 12, 13):

- a) $M_F(r) \leq 2(A_F(1) - \operatorname{Re} F(0,0))((1-r^{1/n})^{-2}-1) + |F(0,0)|$, where n is the

least integer not smaller than $\sup_{\mathcal{T}} \frac{d \ln r_1(\mathcal{T})}{d \ln \mathcal{T}}$.

b) $\ln m_F(r) > -2((1-r^{1/n})^{-2}-1) \ln M_F(1)$ under the condition that

$F(w, z) \neq 0$ if $(w, z) \in D$, and that $F(0, 0) = 1$.

Besides the author obtains some other inequalities of the same type.

Card 2/2

16(1)

AUTHOR: Bavrin, I.I.

SOV/20-126-5-1/69

TITLE: Estimations in the Theory of Analytic Functions of two Complex Variables

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 5, pp 919-922 (USSR)

ABSTRACT: The author generalizes estimations for the functions of Schur, Caratheodory etc. to corresponding functions of two complex variables.

Let $D \ni (0,0)$ be a bounded, complete, bicircular domain, the boundary of which is two times continuously differentiable and analytically convex from outside. Temlyakov [Ref 1] showed that D can be defined as a domain bounded by the hypersurface $|w| = r_1(\tau)$, $|z| = r_2(\tau)$, $0 \leq \tau \leq 1$, whereby $r_1(\tau)$ and $r_2(\tau)$ satisfy certain conditions (see [Ref 1]). Let those domains D be denoted by D_r for which the curves, corresponding to the limits of these domains in the "absolute quarter plane", are convex or form straight lines. Let D_r denote a bicircular domain containing its center $(0,0)$ and which is bounded by the

Card 1/4

Estimations in the Theory of Analytic Functions
of two Complex Variables

SOV/20-126-5-1/69

hyper surface $|w| = r r_1(\tau)$, $|z| = r r_2(\tau)$, $0 < r \leq 1$,
whereby $r_1(\tau)$ and $r_2(\tau)$ satisfy the conditions of Temlyakov.

Theorem: If $F(w, z) = \sum_{m,n=0}^{\infty} a_{mn} w^m z^n$ is regular in D and

$|F(w, z)| \leq 1$, then it is

$$|a_{mn}| \leq \frac{1 - |a_{00}|^2}{r_1^m \left(\frac{m}{m+n}\right) r_2^n \left(\frac{m}{m+n}\right)}$$

where $m + n > 0$ and $0^0 = 1$.

Theorem: Let $F(w, z)$ be regular in D_1 and $\operatorname{Re} F(w, z) \geq 0$ in D_1 .
Then in D_1 it holds :

Card 2/4

Estimations in the Theory of Analytic Functions
of two Complex Variables

SOV/20-126-5-1/69

$$\left| w F'_w(w, z) + z F'_z(w, z) \right| \leq \frac{2a \operatorname{Re} F(w, z)}{1 - a^2}$$

where

$$a = \begin{cases} \frac{|w|}{r_1(1)} & \text{for } z = 0, \quad \frac{|z|}{r_2(0)} \quad \text{for } w = 0 \\ \max_{0 < \tau < 1} \left[\tau \frac{|w|}{r_1(\tau)} + (1 - \tau) \frac{|z|}{r_2(\tau)} \right] & \text{for the other points of } D_1. \end{cases}$$

Theorem : If $F(w, z)$ is regular in D_1 , $F(0, 0) = 1$, $F(w, z) \neq 0$ in \bar{D}_1 , then it is

$$\ln |F(w, z)| \geq -\frac{2a}{1-a} \ln M_F(1), \quad M_F(1) = \max_{\substack{|w|=r_1(\tau) \\ |z|=r_2(\tau)}} |F(w, z)|$$

Card 3/4

Estimations in the Theory of Analytic Functions
of two Complex Variables

SCV/20-126-5-1/6

Altogether there are six theorems. Functions for which the given estimations are obtained are given in most cases in subsequent remarks so that the estimations are rigorous. The proofs are based on the integral representation of the boundary in D_r according to Temlyakov [Ref 2].

The author thanks Professor A.A. Temlyakov.

There are 9 references, 8 of which are Soviet and 1 English.

Title : Terminal Period of Acute Irradiation Disease

Orig Pub : Med radiologiya, 1957, 2, No 2, 31-41

Abstract : The terminal stage was studied in rabbits that died 7 - 15 days after a single X-ray irradiation with a total dose of 1,000 r. A disturbance in the activity of the cerebral cortex and lower cerebral sectors preceding fall of blood pressure and depression of the action of heart and respiration was noted in a number of cases. Activation, prior to depression, of the functions of vitally important systems (elevation of blood pressure, more frequent and deeper respiration), elevation of blood pressure after transection of the vagus

TITLE: The central link of the vascular unconditioned reflex arch in radiation sickness

PERIODICAL: Radiobiologiya, v. 2, no. 2, 1962, 265-271

TEXT: The excitability of the vasomotor center was examined during radiation sickness. 9 rabbits were subjected to a whole-body irradiation of 1000r. Two platinum electrodes, 0.2 mm in diameter and 0.1 mm apart, were inserted into the fundus of the rhomboid foses of a rabbit 3-5 weeks prior to irradiation. The site of the electrodes was chosen by the response to stimulation. Blood pressure was examined in the carotid artery till the death of the animals. The excitability of both the pressor and depressor part increased after irradiation. In 5 out of 9 rabbits a reversal in the characteristics of the response occurred after irradiation. This is explained by the increased excitability of the pressure center which easily becomes over-excited and passes to the state of protective inhibition (lasting only 24 hours.) Subsequently the resistance of this center returned to its original value. The resistance of the depressor part of the vasomotor center decreased 24 hours after irradiation and the blood pressure increased during radiation sickness. The tonus of the depressor center increased before death, resulting, probably, in the observed decrease in blood pressure. Irradiation brings about changes in the cardiac center as well. The cardiac activity decreased following a threshold stimulus

X
Card 1/2

The central link of the vascular...

S/205/62/002/002/007/015

but blood pressure did not change. A maximal decrease of blood pressure was observed within 5-24 hours after irradiation. The pressure returned to its initial level 2 days later dropping again a few hours before death. Changes in the excitability of the vasomotor center might be responsible for the appearance of the hemodynamic disorders observed in radiation sickness. There are 3 figures.

TITLE: Some data on a comparative physiological-hygienic evaluation of protective clothing made of synthetic and natural fibers

SOURCE: Gigiyena i sanitariya, no. 6, 1965, 12-18

TOPIC TAGS: protective clothing, synthetic fiber, human engineering

ABSTRACT: Although fabrics made of synthetic fibers surpass natural-fiber fabrics in mechanical properties, there have been complaints about their physiological and hygienic aspects. Therefore, the authors performed a comparative investigation of the hygienic and physiological properties of fabrics made of polyacrylonitrile fiber (nitron) and polyester fiber (lavan), the control used was the pure-wool fabric "boston" (in hygienic tests) and a suit made of this fabric (in physiological tests). The tests were performed in a microclimatic chamber with controlled temperature and humidity, using two healthy male subjects 26 and 30 years old who during the observations performed a standard amount of regulated work. The findings revealed that synthetic clothing, both regular and protective, may be used (along with clothing of natural fabrics)

Card 1/2

in an environment with temperatures ranging from 18 to 35°C and a moisture content of 30-60% (in the absence of infrared radiation sources). In the temperature range between 18 and 28°C and in the presence of 30-60% humidity, during the performance of physical work of average stress, synthetic-fiber clothing assures adequate thermal comfort for humans. As the temperature drops to 15°C, synthetic-fiber suits in combination with cotton underwear do not assure adequate warmth. In an environment with a temperature of 50°C and humidity of 20-25%, workers in synthetic-fiber suits experience thermal discomfort and the functional systems of the organism become sharply upset. The lower (as compared with natural-fabric clothing) thermal resistance and water resistance of synthetic fabrics are the principal hygienic indexes restricting the possibility of widespread use of clothing made of these fabrics. purpose. This collection of articles is intended for metallurgical engineers,
practitioners, and workers in the machine-building and radioengineering industries.
It may also be used by students of schools of higher education.

contents. The collection contains technical papers which were presented and dis-
cussed at the First All-Union Conference on Rare-Metal Alloys held in the In-
stitute of Metallurgy, Academy of Sciences USSR in November 1957. Results of
investigations of technological alloys, their physical properties, alloys with ad-
ditions of rare metals are presented, and discussions along the investigations of
rare metal substitution for base alloys. The effect of rare metal
on properties of magnesium alloys and steels is analyzed. The effect of rhodium
as a deoxidizer for magnesium, electroplating materials, and metal all suitable for
making plating for automobile electrical systems are discussed. Some
of the sections of certain elements on the properties of base metals
and aluminum alloys with special physical properties (particularly
conductivity alloy) are discussed. In parentheses are indicated series
and headings, numbers, and names of the articles.

TITLE: Mechanical properties and structure of cold-extruded aluminum-alloy tubes and bars

SOURCE: Tsvetnyye metally, no. 9, 1965, 67-71

TOPIC TAGS: aluminum alloy, alloy extrusion, extrusion, alloy tube, alloy bar, tube extrusion, bar extrusion, alloy mechanical property

ABSTRACT: The feasibility of cold extrusion of aluminum alloy tubes and bars has been investigated. D1, AV, D1, and D16 alloy tubes 9, 8, or 7.2 mm in diameter, with respective wall thickness of 1.5, 1, or 1.1 mm, were cold extruded from hot extruded shells, at extrusion ratios of 14.2, 23.3 or 40. The mechanical properties of tubes 300-400 mm long were roughly equal to those of tubes produced by conventional methods (hot extrusion and cold rolling). For instance, cold-extruded D16 alloy tubes after heat treatment had a tensile strength of 43-50 kg/mm², a yield strength of 26 to 38 kg/mm², and an elongation of 14-20%, compared to 42 kg/mm², 26 kg/mm², and 14%, respectively, for conventionally made tubes. The mechanical properties of cold-extruded AV and D1 alloy tubes 1500 mm long decreased toward the rear end (a result of grain coarsening), but not below the values required by specifications. Cold-ex-

Card 1/2

L 5028-66

ACC NR: AP5022379

truded D1 alloy tubes 16 mm in diameter and 1500—2000 mm long, tested in the as-extruded, annealed, and heat-treated conditions, were found to have technological properties (in bending, expanding, and squeezing tests) similar to those of conventionally made tubes, but a somewhat lower tensile strength (by 1 kg/mm²) and yield strength (by 3 kg/mm²) and a 5% higher elongation. An insignificant anisotropy of mechanical properties was observed in cold-extruded V96 alloy tubes tested in the as-extruded condition. The AD1, AV, and D16 alloy bars^{30, 25, 18, or 16 mm} in diameter cold extruded at extrusion ratios of 7, 10, 19, or 24 had better mechanical properties than those of bars produced by conventional methods; σ_{13} , $\sigma_{0.2}$, and σ_r were 40 kg/mm², 26 kg/mm², and 12%, respectively. TITLE: Influence of structure on the mechanical properties of pressed products manufactured from alloy D16 for different types of applied loads

SOURCE: AN SSSR. Institut metallurgii. Metallovedeniye legkikh splavov (Metallography of light alloys). Moscow, Izd-vo Nauka, 1965, 166-172

TOPIC TAGS: solid mechanical property, tensile strength, aluminum alloy / D16 aluminum alloy

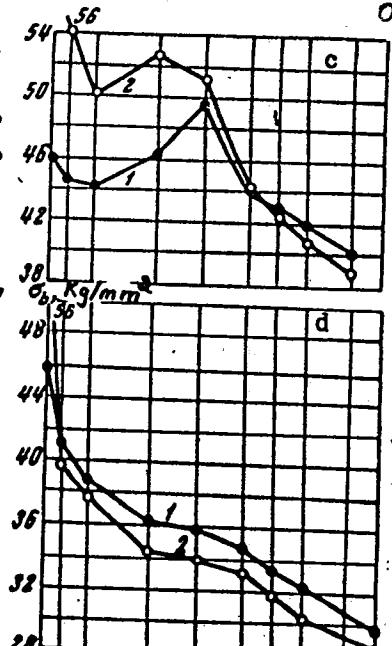

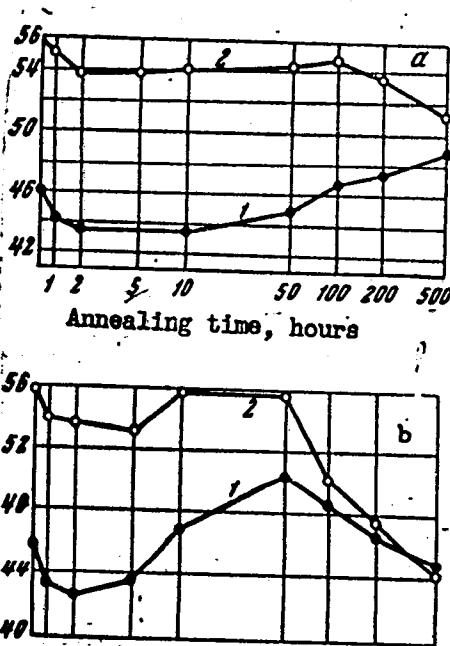

ABSTRACT: The effect of recrystallization on the mechanical properties of parts manufactured from alloy D16 was investigated. The investigation supplements the results of V. I. Dobatkin (O presseffekte v aliuminiyevykh splavakh, Sb. Issledovaniye splavov tsvetnykh metallov, vyp. 3 Izd-vo AN SSSR, 1962). The mechanical properties and microstructure of nonrecrystallized and recrystallized specimens were determined as a function of the type and magnitude of applied load. The experimental results are presented in graphs and tables (see Fig. 1). It was found that artificial aging of the alloy at elevated temperatures tended to smooth out any differences in the mechanical properties of non- and recrystallized specimens.

TITLE: Concerning the geometry of samples of selenium with spectral
memory 27

SOURCE: IVUZ. Fizika, no. 5, 1964, 182-184

TOPIC TAGS: selenium photocell, anomalous photoconductivity,
mercury vapor treatment, photocell resistance, photosensitivity

ABSTRACT: One of the authors (Mokhov et al., Izv. vuzov SSSR,
Fizika, No. 4, 1959 and FTT v. 3, No. 9, 2667, 1961) has previously
observed that certain samples of selenium treated with mercury¹
vapor has spectral memory (anomalous photoconductivity), but the pro-
duction of such samples is difficult to control at the present time,
owing to the lack of a convincing explanation of either the mechanism
of the anomalous photoconductivity and the processes which lead to

Card 1/4

L 13084-65

ACCESSION NR: AP4047368

its occurrence. Other tests by the same authors (FTT v. 3, No. 5, 1366, 1961 and v. 5, No. 2, 559, 1963) have shown that this anomalous photoconductivity is confined to the region near the electrodes. The present investigation was made with the geometry illustrated in Fig. 1 of the enclosure, and confirmed the previous conclusions. After deposition of the upper electrodes the resistance of the samples decreased by 2--3 orders of magnitude and the sensitivity vanished. However, 40--50 hours after the deposition of the upper electrodes the conductivity of the samples resumed its initial value without any external influence, and the samples returned to their previous photosensitivity. Only the regions near the electrode (AB and CD of the figure) proved to be photosensitive. This is also confirmed by the fact that if the samples are again placed in a mercury vapor atmosphere after formation of the upper electrodes, their resistance does not change, and no HgSe film is produced in the region near the electrodes. The fact that the mercury does not diffuse from the gaseous phase into the regions near the electrode is

Card 2/4

I 13084-65

ACCESSION NR: AP4047368

due to the influence of the space charge which extends into the selenium layer in this region. It is noted that samples with the geometry shown in the figure also have anomalous photoconductivity, so that the selenium layer over the lower electrodes does not influence the occurrence of spectral memory in these samples. Orig. art. has: 3 figures.

TITLE: Distribution of the photosensitivity of selenium samples.
having anomalous photoconductivity 27

SOURCE: IVUZ, Fizika, no. 1, 1966, 182-183

TOPIC TAGS: selenium, photoconductivity, photosensitivity, mercury
containing alloy

ABSTRACT: This is a continuation of earlier studies of the photoconductivity of selenium treated with mercury vapor (Izv. vuzov SSSR, Fizika, No. 5, 182, 1964 and others). In the present paper the authors present experimental results of an investigation of the distribution of the photosensitivity in the light-sensitive region near the electrode. The investigation was made with a specially prepared setup, in which an optical probe of width 0.1 mm was produced. The sample 2

Card 1/2

L 24362-66

ACC NR: AP6008117

was moved relative to the optical probe with the aid of a micrometer screw, so that the photosensitivity of different sections of the sample could be determined. The spectral components were determined with a monochromator (UM-2). The sample preparation technology was described in the earlier paper. The maximum relative photosensitivity (increase of photosensitivity above its dark value) occurred at approximately 0.25 mm from the edge of the metallic electrode with which the photosensitive region is in contact, regardless of the wavelength of the applied light. In the case of wavelengths longer than 5300 Å, all the regions of the selenium layer had only positive photoconductivity. At lower wavelengths, certain sections of the region next to the electrode had negative photoconductivity. Qualitatively comparable results were obtained for both positive and negative voltage applied to the electrode. The results confirm the earlier deductions that the mercury atoms do not penetrate uniformly in the electrode regions of the investigated samples during production of the layer. Orig. art. has: 2 figures.

| <i>Flight</i> | | | |
| Flight indicators of avian as a synthesis of the results presented in the cited mentioned evidence on the creation of a large-scale industry. In Moscow, Siberia, and in local areas, especially the Ural region, the development of the bird industry is increasing. To meet the purpose of practical coordination between the activities of the government structures and the bird breeding, large-scale industry and business interests, the experts believe that there must be a centralized organization which coordinates the management of these new provide the development interests of local and regional industry. Related officials also report on the following subjects: animal husbandry and agriculture, the development of the local agricultural industry in Moscow, industrial economy and industry, nutrition, agriculture, etc. | 33 | | |
